Milestone 1: Item Class Hierarchy

Objective: Create a class hierarchy to represent different item types.

Tasks:

1. **Create Base Class `Item`:**
    - Define common attributes:
        - `String id` (unique identifier).
        - `String name` (name of the item).
        - `double price` (price of the item).
        - `int quantity` (quantity in stock).
    - Implement constructors and getter/setter methods.
2. **Create Subclasses for Specific Item Types:**
    - **Electronics**: Add `int warranty` attribute.
    - **Clothing**: Add `String size` attribute.
    - **Book**: Add `String author` attribute.
3. **Implement `Comparable<Item>` IInterface:**
    - Learning Resource : Comparable Interface in Java with Examples- Scaler Topics
    - Write a `compareTo` method to sort items alphabetically by `name`

Milestone 2: Generic Inventory Management

Objective: Implement a generic inventory system for managing items.

Tasks:

1. **Design the `Inventory<T extends Item>` Class:**
    - Use `HashMap<String, T>` to store items, where `id` is the key.
2. **Add Core Methods to Inventory:**
    - `addItem(T item)`: Add an item to the inventory.
    - `removeItem(String id)`: Remove an item by `id`.
    - `getItem(String id)`: Retrieve an item by `id`.
    - `getAllItems()`: Return all items as a `List<T>`.
3. **Write Tests for Inventory:**
    - Add, retrieve, and remove items.
    - Verify behavior when trying to add items with duplicate IDs.

Milestone 3: Recently Viewed Items

Objective: Maintain a list of recently viewed items using `LinkedList`.

Tasks:

1. **Use `LinkedList<Item>` for Recently Viewed Items:**
    - Create a `LinkedList<Item>` to store recently viewed items.
2. **Add Helper Methods:**
    - `addRecentlyViewedItem(Item item)`:
        - Add the item to the list. Explore methods available in LinkedList to implement this.
        - Ensure the list size doesn't exceed 3. Remove the oldest item if exceeded.
3. **Test Recently Viewed List:**
    - Add more than 3 items and ensure the oldest items are removed correctly.

Milestone 4: Order Processing with Priority Queue

Objective: Process orders by prioritizing express orders using a `PriorityQueue`.

Tasks:

1. **Create the `Order` Class:**
    - Attributes:
        - `String orderId`.
        - `boolean isExpress` (true for express orders, false for regular ones).
2. **Implement the Order Queue:**
    - Use `PriorityQueue<Order>` to store orders.
3. **Write Methods for Order Queue:**
    - `addOrder(Order order)`: Add an order to the queue.
    - `processOrder()`: Process and remove the highest-priority order (express orders first).
4. **Test Order Queue:**
    - Add multiple express and regular orders.
    - Test if express orders are processed first.

Milestone 5: Sorting and Filtering Options

Objective: Enable sorting and filtering of items based on different criteria.

Tasks:

1. **Implement Custom Comparators:**
    - Write Comparators for sorting by:
        - `price`.
        - `quantity`.
2. **Add Filtering Methods in Inventory Class:**
    - `filterByPriceRange(double minPrice, double maxPrice)`: Return items within a price range.
    - `filterByAvailability()`: Return items with `quantity > 0`.
3. **Test Sorting and Filtering:**
    - Test sorting and filtering methods with a list of items.

Milestone 6: Customer Wishlist

Objective: Manage a customer's wishlist using a `Set` to ensure uniqueness.

Tasks:

1. **Use `Set<Item>` for Wishlist:**
    - Create a `Set<Item>` to store the wishlist.
2. **Add Wishlist Methods:**
    - `addToWishlist(Item item)`: Add an item to the wishlist.
    - `removeFromWishlist(Item item)`: Remove an item from the wishlist.
3. **Test Wishlist Functionality:**
    - Add duplicate items and verify that only unique items are stored.
